

Turning mobile numbers into leads

From MSISDN to network, device and linked intelligence in seconds

Mobile numbers are often the first identifier available in an investigation, but turning that number into useful intelligence can take time, authority and specialist resource.

NMPR Number Intel gives authorised users a fast way to search a UK mobile number and return network and device-related information directly within NMPR. Where available, it can identify the associated IMEI and connect that device to the wider NMPR intelligence picture.

This helps investigators move quickly from a mobile number to actionable lines of enquiry, supporting both proactive and reactive policing activity.

Analysis of almost 8,000 recent UK law enforcement searches showed that 99.7% returned current and original network data, with results delivered in under five seconds.

Not every search will return a linked handset, but every result can help narrow the next step — whether that means identifying the current network, confirming a SIM or device change, or supporting a more targeted communications data request.

Number Intel enables users to:

- Search by UK mobile number directly within NMPR
- Identify the current and original network responsible for the number
- See SIM swap and device swap indicators where available
- Reveal an associated IMEI in supported searches
- Connect returned IMEIs to wider NMPR device history
- Support faster, more focused early-stage enquiries

Crime Reduction Ecosystem

Powered by
Recipero

For over 25 years, Recipero has gathered data and built relationships with police, partners, clients and the public to create its crime reduction ecosystem.

Number Intel adds to NMPR by bridging mobile numbers and existing device intelligence. When an IMEI is linked to a number, NMPR can surface relevant device history, searches, reports and wider activity.

Benefits include:

Network and device insight
Identify current network, original network, SIM activity and associated IMEI where available.

MSISDN to device intelligence
In recent UK law enforcement use, 29% of searches returned the currently active IMEI, helping users move from a mobile number to device-level intelligence.

Early-stage enquiry support
Help officers assess leads quickly before committing time or resource to more formal processes.

Wider NMPR attribution
Where an IMEI is returned, connect the handset to existing NMPR device history and linked activity.

Data summary:

- ✓ Current network data
- ✓ Original network data
- ✓ SIM swap indicators
- ✓ Device swap indicators
- ✓ MSISDN to IMEI links
- ✓ NMPR device history
- ✓ Linked ecosystem activity
